## What Are QR codes?

They look like this:

QR is short for **Quick Response** (they can be read quickly by mobile devices equipped with a camera like a mobile phone or tablet PC). They are used to take information in printed form and transfer it into your mobile device. Once it's scanned into your mobile device, a QR code can give you details about a business, show you a URL which you can click to see detailed product information, watch a product demo or even give you a coupon which you can use at a local business.

A key feature of QR Codes is that instead of requiring a bulky hand-held scanner to scan them, many mobile devices equipped with a camera can scan them. All your mobile device needs is a QR code reader app available for free at most app stores. It takes literally just a minute to find and install the reader app. Once installed, just open the app, scan the QR code and you're done. It's that simple.
